

Introduction

- Spaces define feature visibility
- Roles define access levels to features
- Using *both* is useful when everyone using a space should not see the same features
 - Space and role privileges both affect feature visibility
 - We'll look at how this combination works in this lecture

Defining privileges only with spaces

- We might need a lot of spaces
- We are unable to define access levels to features
- A space configuration should apply to everyone using the space
- Privileges for individual users should be configured with roles
