

# Basics of dashboards

- Dashboards typically display **related data** (i.e. from the same data source)
  - E.g. a dashboard for access logs, and one for orders
  - This is not a requirement, though
- Dashboards are often designed with their users in mind
- We can also **interact with dashboards**
  - ... and navigate between them with *drilldowns*
- Let's begin by **building our first dashboard!** 🚀
