

Introduction to spaces

- Spaces define feature visibility and organize saved objects
- Saved objects are dashboards, visualizations, index patterns, etc.
- We'll get back to what it means to organize these objects
- We are *always* using a space

Organizing saved objects

- Enables us to control which objects are available within a space
- Lower level access control than feature visibility
- Within a space, only objects belonging to the space can be accessed
- Create objects within the appropriate spaces
- ... or alternatively copy them between spaces
